

Deployment Profile Creation

This document outlines how to create a Deployment Profile.

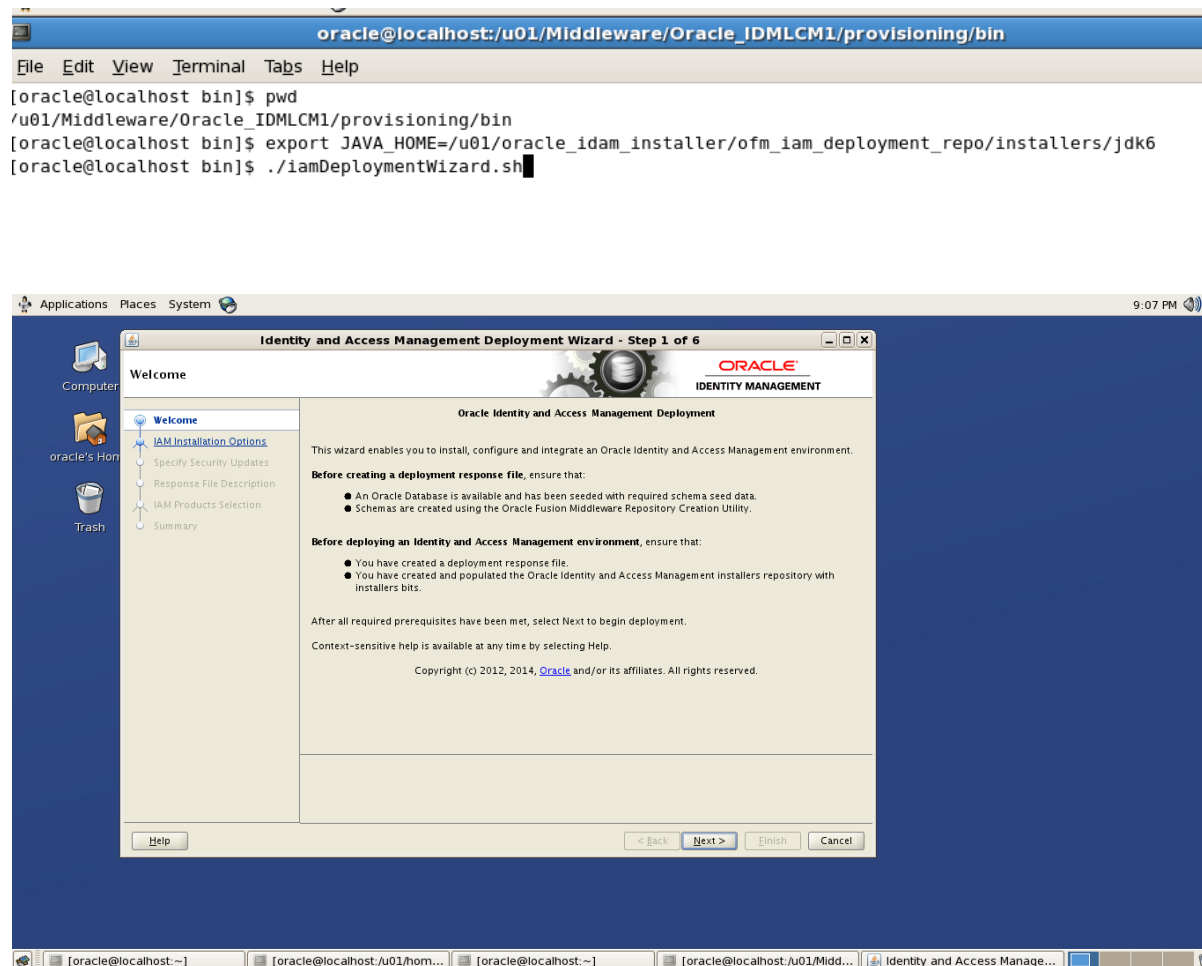

A **Deployment Profile** is a file which is used by the deployment process to **automate** the whole installation. The profile creation process (below) involves **providing our topology information** to the wizard so that the file can be created and leveraged to automate the deployment

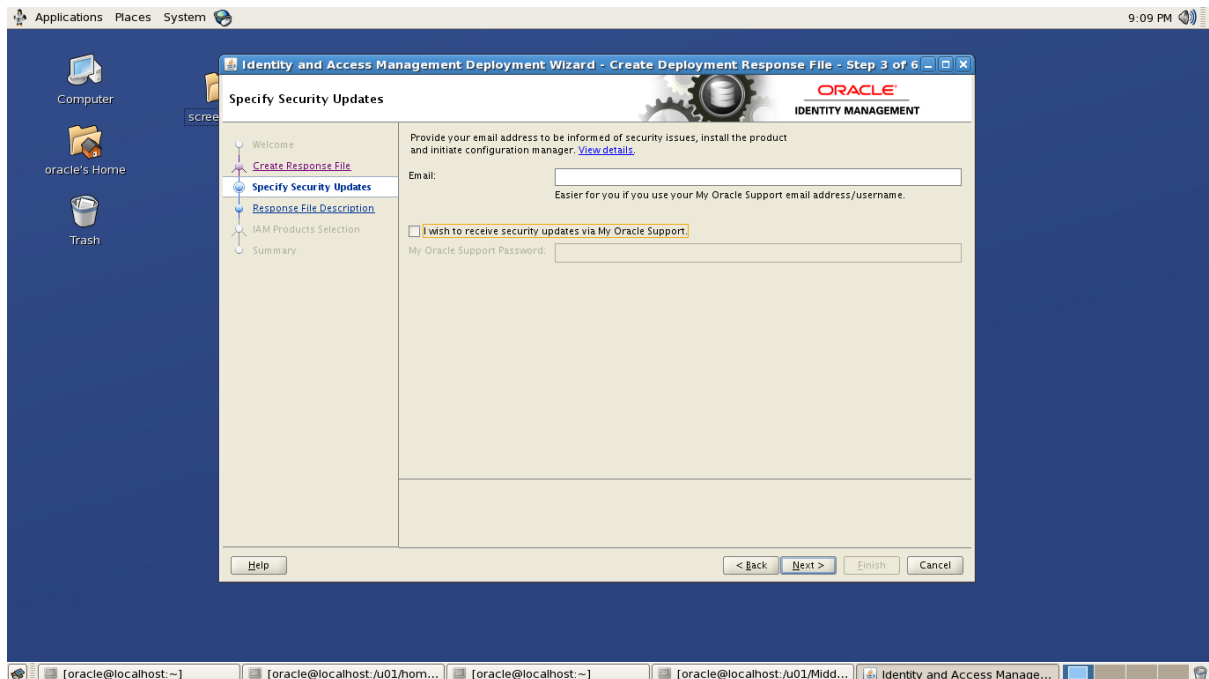

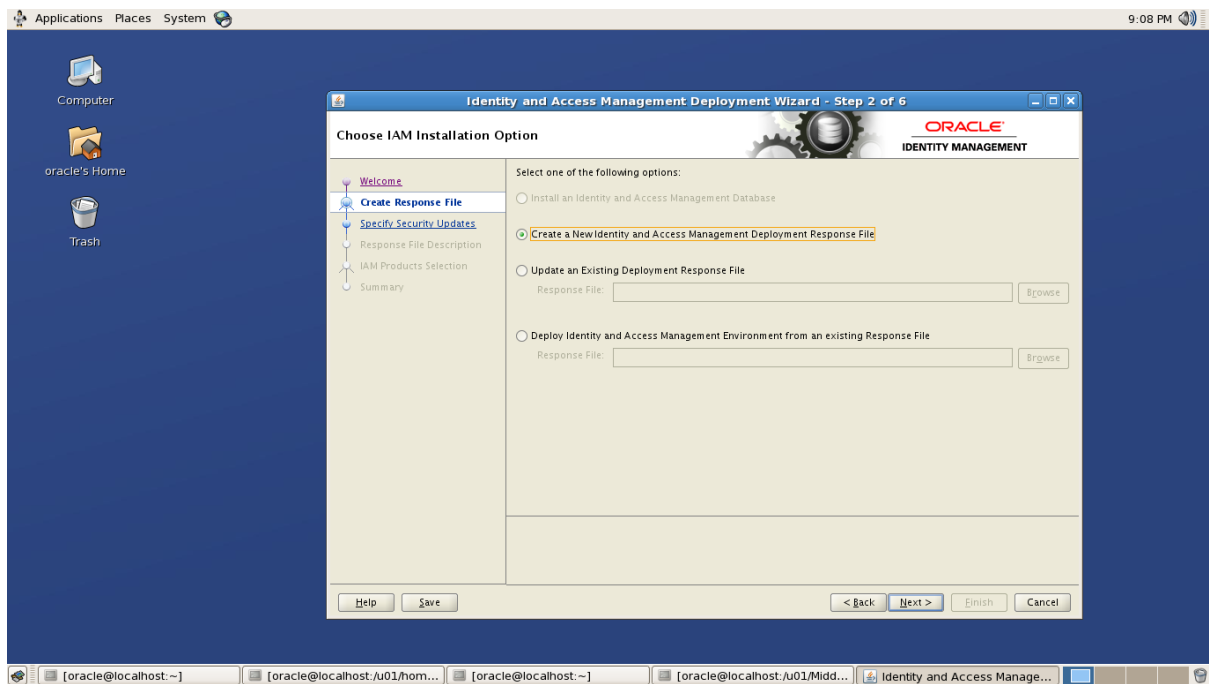

Execute the below commands to initiate the process

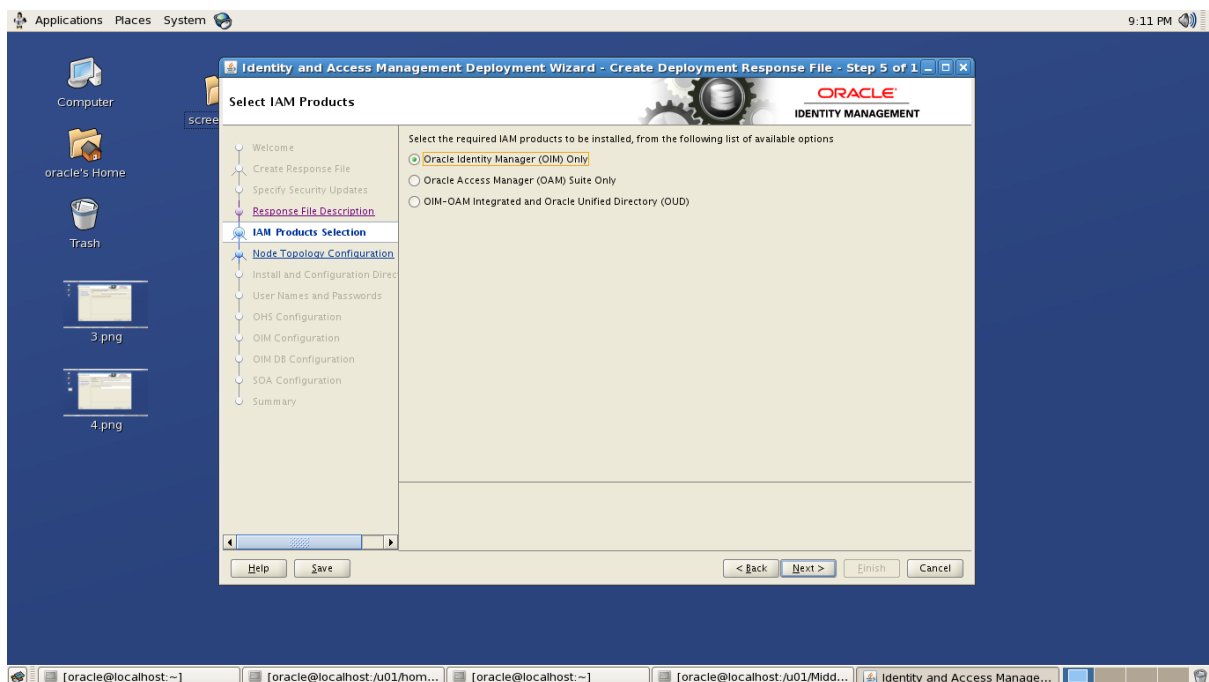

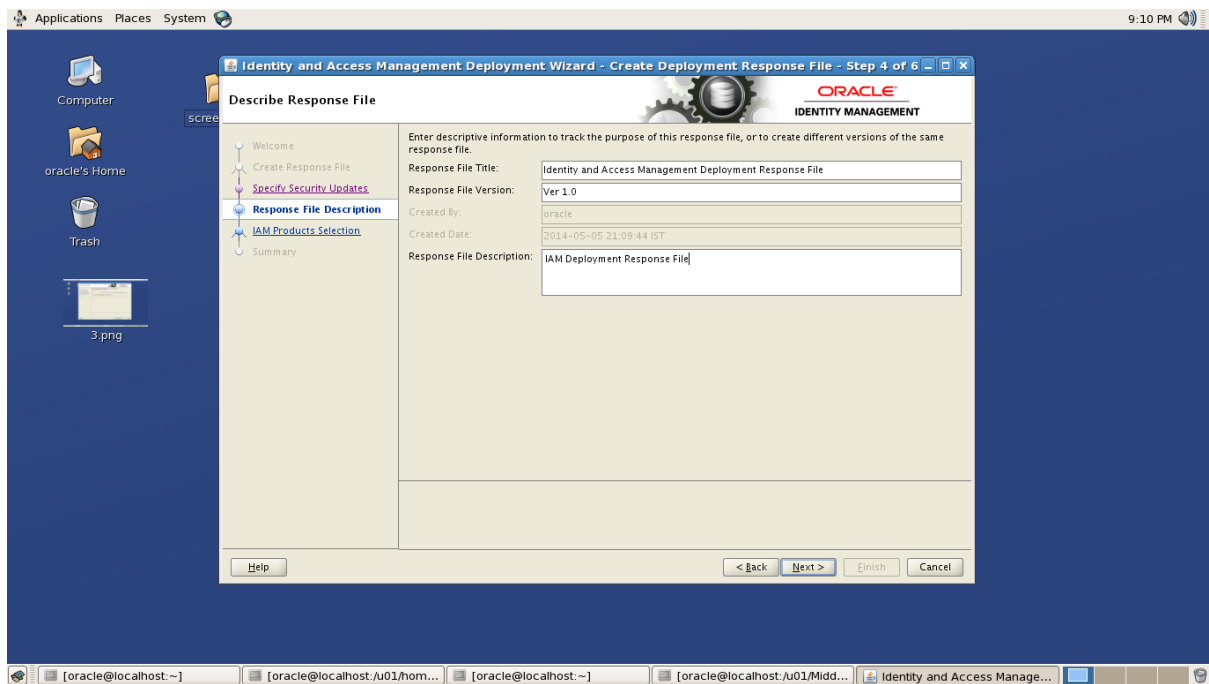

```
cd /u01/Middleware/Oracle_IDMLCM1/provisioning/bin
```

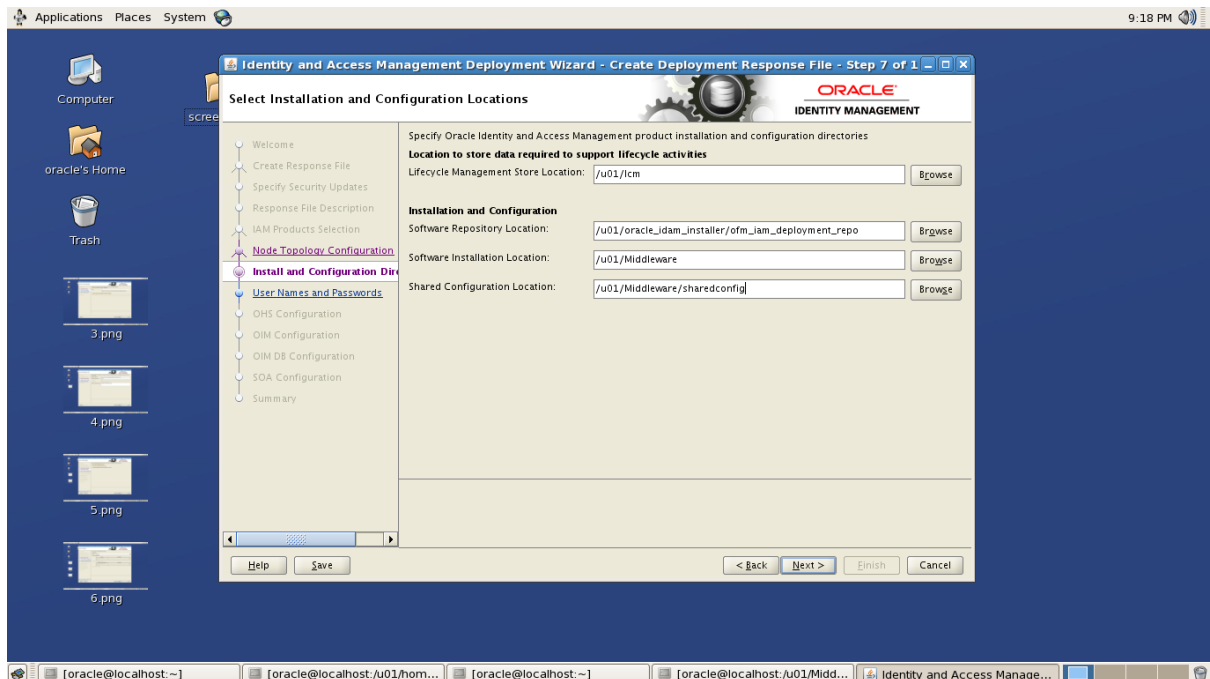

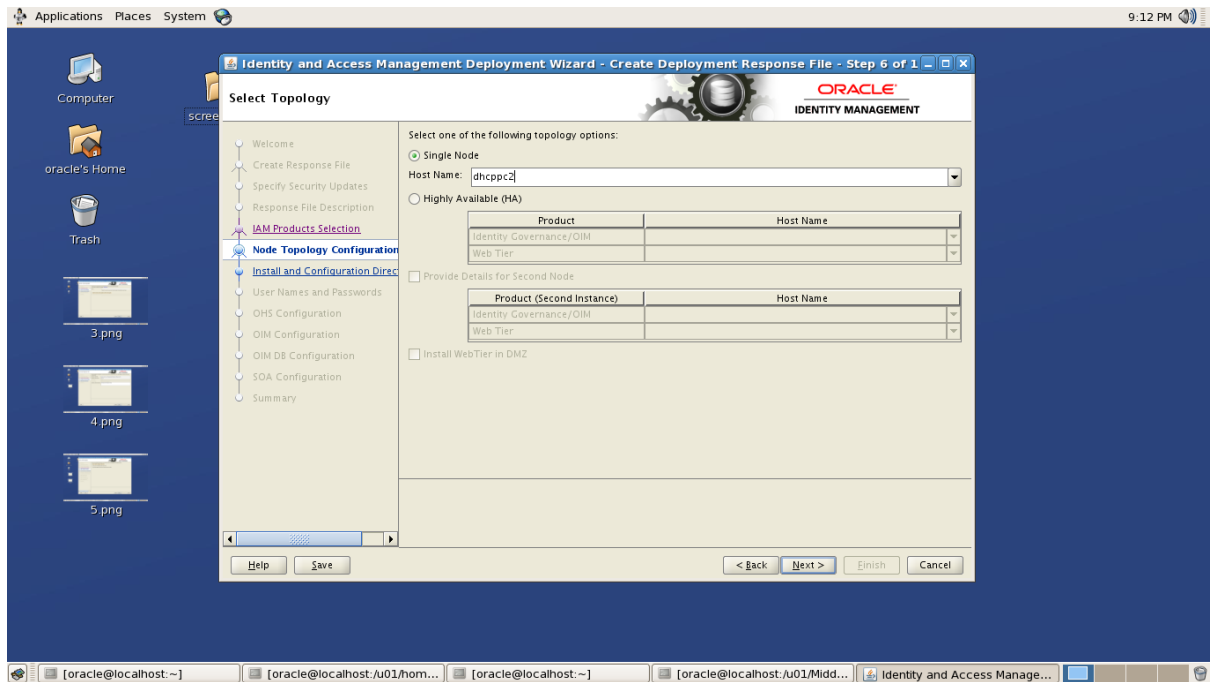

```
export JAVA_HOME=/u01/oracle_idam_installer/ofm_iam_deployment_repo/installers/jdk6
```

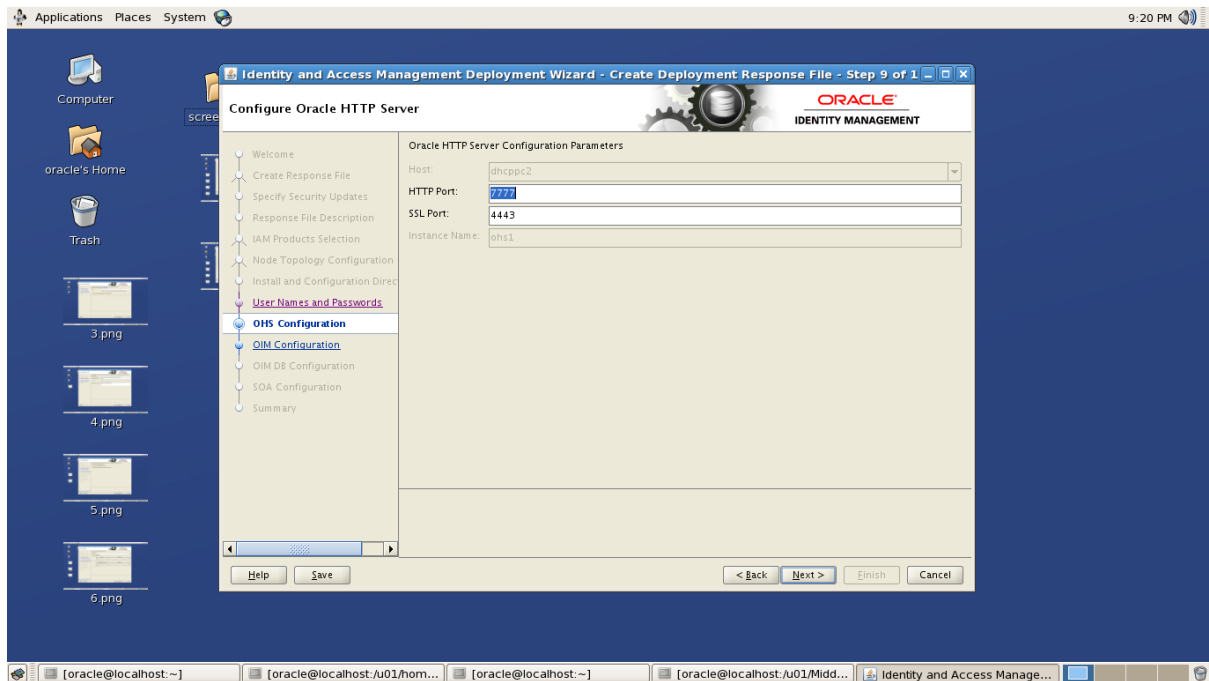

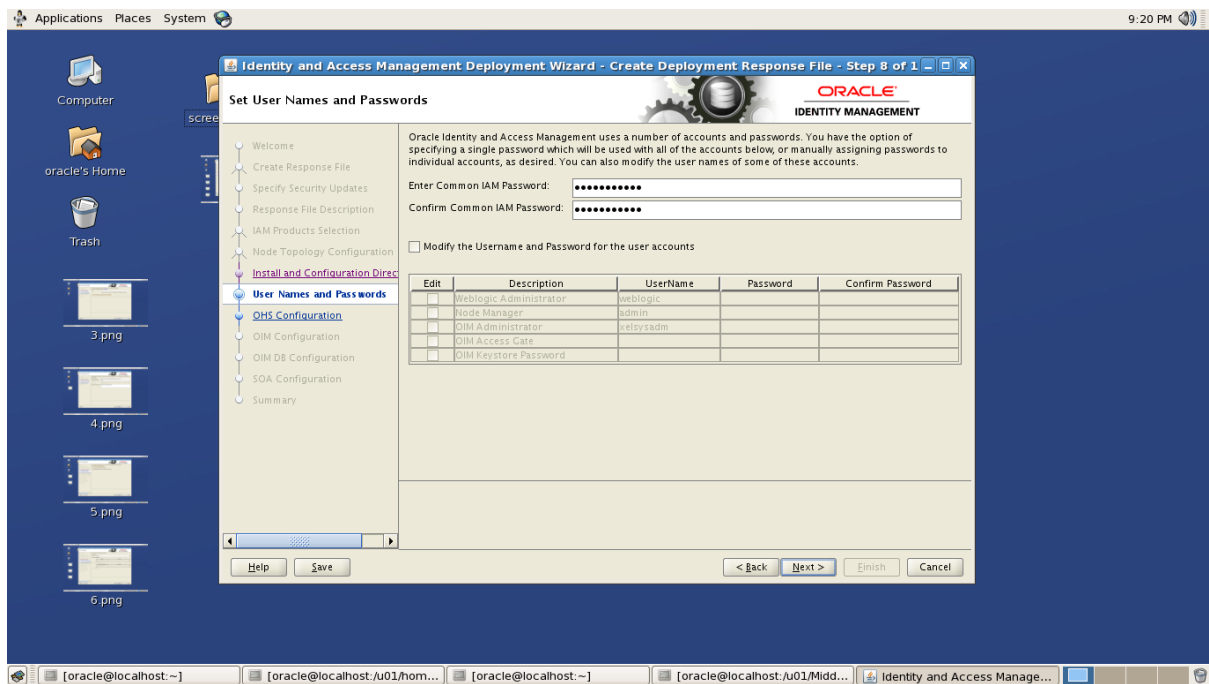

```
./iamDeploymentWizard.sh
```

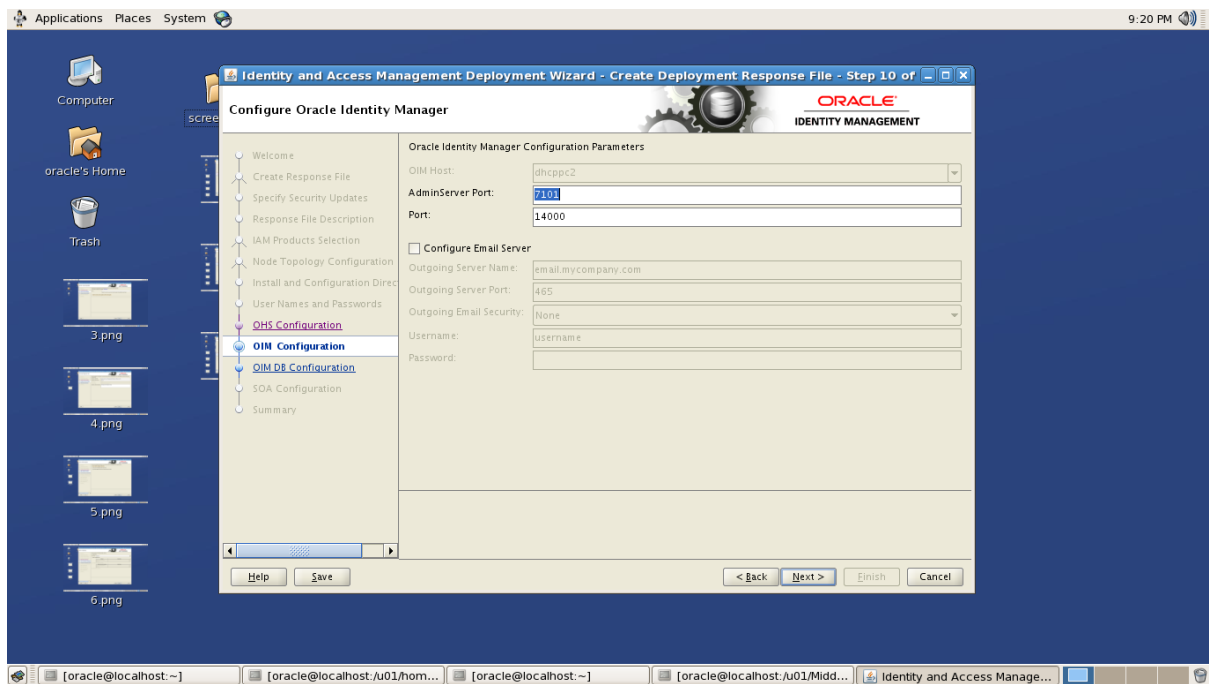

Enter the schema password (*used during RCU creation*)
